

# Functional Dependencies and Normalization

Jose M. Peña  
jospe@ida.liu.se

\* slides kindly provided by Vaida Jakonienė

## Overview

## Good Design

- Can we be sure that a translation from EER-diagram to relational tables results in good database design?
- Confronted with a deployed database, how can we be sure that it is well-designed?
- What *is* good database design?
  - Four informal measures
  - Formal measure: normalization

3

## Informal design guideline

- Easy to explain semantics of the relation schema
- Reducing redundant information in tuples
  - Redundancy causes update anomalies:
    - Insertion anomalies
    - Deletion anomalies
    - Modification anomalies

EMP(	<u>EMPID,</u>	EMPNAME,	DEPTNAME,	DEPTMGR)
	123	Smith	Research	999
	333	Wong	Research	999
	888	Borg	Administration	null

4

## Informal design guideline

- Sometimes, it may be desirable to have redundancy to gain in runtime, i.e. trade space for time.
- In that case and to avoid update anomalies
  - either, use triggers or stored procedures to update the base tables
  - or, keep the base tables free of redundancy and use views (assuming that the views are materialized).

5

## Informal design guideline

- Reducing NULL values in tuples
  - Why
    - Efficient use of space
    - Avoid costly outer joins
    - Ambiguous interpretation (unknown vs. doesn't apply).
- Disallow the possibility of generating spurious tuples
  - Figures 10.5 and 10.6: cartesian product results in incorrect tuples
  - Only join on foreign key/primary key-attributes
  - Lossless join property: guarantees that the spurious tuple generation problem does not occur

6

## Functional dependencies (FD)

- Let  $R$  be a relational schema with the attributes  $A_1, \dots, A_n$  and let  $X$  and  $Y$  be subsets of  $\{A_1, \dots, A_n\}$ .
- Let  $r(R)$  denote a relation in relational schema  $R$ .

We say that  $X$  *functionally determines*  $Y$ ,  $X \rightarrow Y$  if for each pair of tuples  $t_1, t_2 \in r(R)$  and for all relations in  $r(R)$ :  
If  $t_1[X] = t_2[X]$  then we must also have  $t_1[Y] = t_2[Y]$

- Despite the mathematical definition an FD cannot be determined automatically. It is a property of the semantics of attributes.

7

## Inference rules

- If  $X \supseteq Y$  then  $X \rightarrow Y$ , or  $X \rightarrow X$  (reflexive rule)
- $X \rightarrow Y \models XZ \rightarrow YZ$  (augmentation rule)
- $X \rightarrow Y, Y \rightarrow Z \models X \rightarrow Z$  (transitive rule)
- $X \rightarrow YZ \models X \rightarrow Y$  (decomposition rule)
- $X \rightarrow Y, X \rightarrow Z \models X \rightarrow YZ$  (union or additive rule)
- $X \rightarrow Y, WY \rightarrow Z \models WX \rightarrow Z$  (pseudotransitive rule)

8

## Inference rules

- Textbook, page 341:  
"...  $X \rightarrow A$ , and  $Y \rightarrow B$  does *not* imply that  $XY \rightarrow AB$ ."  
Prove that this statement is wrong.
- Prove inference rules 4, 5 and 6 by using **only** inference rules 1, 2 and 3.

9

## Definitions

For any relation extension or state

- Superkey:** a set of attributes uniquely (but not minimally!) identifying a tuple of a relation.
- Key:** A *set of attributes* that uniquely and minimally identifies a tuple of a relation.
- Candidate key:** If there is more than one **key** in a relation, the keys are called candidate keys.
- Primary key:** One **candidate key** is chosen to be the primary key.
- Prime attribute:** An attribute **A** that is part of a **candidate key X** (vs. nonprime attribute)

10

## Normal Forms

- 1NF, 2NF, 3NF, BCNF (4NF, 5NF)
- Minimize redundancy**
- Minimize update anomalies**
- Normal form  $\uparrow$  = redundancy and update anomalies  $\downarrow$  and relations become smaller.
- Join operation to recover original relations.

11

## 1NF

- 1NF: The relation should have no non-atomic values.

$R_{\text{non1NF}}$

ID	Name	LivesIn
100	Pettersson	{Stockholm, Linköping}
101	Andersson	{Linköping}
102	Svensson	{Ystad, Hjo, Berlin}

What about multi-valued composite attributes?

Normalization

$R_{1\text{NF}}$

ID	Name
100	Pettersson
101	Andersson
102	Svensson

$R_{2\text{NF}}$

ID	LivesIn
100	Stockholm
100	Linköping
101	Linköping
102	Ystad
102	Hjo
102	Berlin

12

## 2NF

- 2NF: *no nonprime attribute* should be functionally dependent on a *part* of a candidate key (= partial dependency).

$R_{\text{non2NF}}$

<u>EmpID</u>	<u>Dept</u>	Work%	EmpName
100	Dev	50	Baker
100	Support	50	Baker
200	Dev	80	Miller

$R1_{2NF}$

<u>EmpID</u>	EmpName
100	Baker
200	Miller

$R2_{2NF}$

<u>EmpID</u>	<u>Dept</u>	Work%
100	Dev	50
100	Support	50
200	Dev	80

13

## 2NF

- No 2NF: A part of a candidate key can have repeated values in the relation and, thus, so can have the nonprime attribute, i.e. redundancy + insertion and modification anomalies.
- An FD  $X \rightarrow Y$  is a **full functional dependency (FFD)** if removal of any attribute  $A_i$  from  $X$  means that the dependency does not hold any more.
- 2NF: Every **nonprime** attribute is fully functionally dependent on every candidate key.

14

## 3NF

- 3NF: **2NF + no nonprime** attribute should be functionally dependent on a set of nonprime attributes

$R_{\text{non3NF}}$

<u>ID</u>	Name	Zip	City
100	Andersson	58214	Linköping
101	Björk	10223	Stockholm
102	Carlsson	58214	Linköping

$R1_{3NF}$

<u>ID</u>	Name	Zip
100	Andersson	58214
101	Björk	10223
102	Carlsson	58214

$R2_{3NF}$

<u>Zip</u>	City
58214	Linköping
10223	Stockholm

15

## 3NF

- No 3NF (but 2NF): A set of nonprime attributes can have repeated values in the relation and, thus, so can have the nonprime attribute, i.e. redundancy + insertion and modification anomalies.
- An FD  $X \rightarrow Y$  is a **transitive dependency** if there is a set of **nonprime** attributes  $Z$  such that both  $X \rightarrow Z$  and  $Z \rightarrow Y$  hold.
- 3NF: 2NF + **no nonprime** attribute is transitively dependent on any candidate key.

16

## Little summary

- $X \rightarrow A$
- 2NF and 3NF do nothing if  $A$  is prime.
- Assume  $A$  is nonprime.
- 2NF = decompose if  $X$  is part of a candidate key.
- 3NF = decompose if  $X$  is part of a candidate key or  $X$  is nonprime, i.e. if  $X \rightarrow A$  is partial or transitive.
- 3NF =  $X$  is a superkey or  $A$  is prime.
- Should  $A$  be discriminated for being prime ?

## Boyce-Codd Normal Form

- BCNF: **Every determinant is a superkey**  
(in practice: every determinant is a candidate key)
- BCNF = decompose if  $X \rightarrow A$  is such that  $X$  is not a superkey and  $A$  is a prime attribute.
- Example: Given  $R(A, B, C, D)$  and  $AB \rightarrow CD, C \rightarrow B$ . Then  $R$  is in 3NF but not in BCNF
  - $C$  is a determinant but not a superkey (tuples are not uniquely identified in  $R$ )

18

## BCNF: Example

At a gym, an instructor is leading an activity in a certain room at a certain time.

$R_{\text{nonBCNF}}$

Time	Room	Instructor	Activity
Mon 17.00	Gym	Tina	IronWoman
Mon 17.00	Mirrors	Anna	Aerobics
Tue 17.00	Gym	Tina	Intro
Tue 17.00	Mirrors	Anna	Aerobics
Wed 18.00	Gym	Anna	IronWoman

19

## Properties of decomposition

- Keep all attributes from the universal relation R.
- Preserve the identified functional dependencies.
- Lossless join
  - It must be possible to join the smaller tables to arrive at composite information without spurious tuples.

20

## Normalization: Example

Given universal relation

$R(\text{PID}, \text{PersonNamn}, \text{Land}, \text{Kontinent}, \text{KontinentYta}, \text{AntalBesökILandet})$

- Functional dependencies?
- Keys?

21

## Normalization: Example

$\text{PID} \rightarrow \text{PersonNamn}$

$\text{PID}, \text{Land} \rightarrow \text{AntalBesökILandet}$

$\text{Land} \rightarrow \text{Kontinent}$

$\text{Kontinent} \rightarrow \text{KontinentYta}$

- Based on FDs, what are keys for R?
- Use inference rules

22

## Normalization: Example

$\text{Land} \rightarrow \text{Kontinent}, \text{Kontinent} \rightarrow \text{KontinentYta}$ ,  
then  
 $\text{Land} \rightarrow \text{Kontinent}, \text{KontinentYta}$  (transitive rule)

$\text{PID}, \text{Land} \rightarrow \text{Kontinent}, \text{KontinentYta}$  (augmentation rule),

$\text{PID}, \text{Land} \rightarrow \text{PersonNamn}$  (augmentation rule),

$\text{PID}, \text{Land} \rightarrow \text{AntalBesökILandet}$ ,

then  
 $\text{PID}, \text{Land} \rightarrow \text{Kontinent}, \text{KontinentYta}, \text{PersonNamn}, \text{AntalBesökILandet}$  (additive rule)

Person, Land is the key for R.

23

## Normalization: Example

Is

$R(\text{PID}, \text{Land}, \text{Kontinent}, \text{KontinentYta}, \text{PersonNamn}, \text{AntalBesökILandet})$   
in 2NF?

No, *PersonNamn* depends on a part of the key (*PID*), then

$R1(\text{PID}, \text{PersonNamn})$

$R2(\text{PID}, \text{Land}, \text{Kontinent}, \text{KontinentYta}, \text{AntalBesökILandet})$

Is  $R2$  in 2NF?

No, *Kontinent* and *KontinentYta* depend on a part of the key (*Land*), then

$R1(\text{PID}, \text{PersonNamn})$

$R21(\text{Land}, \text{Kontinent}, \text{KontinentYta})$

$R22(\text{PID}, \text{Land}, \text{AntalBesökILandet})$

$\rightarrow R1, R21, R22$  are in 2NF

2NF: no nonprime attribute should be functionally dependent on a *part* of a candidate key.

24

### Are R1, R21, R22 in 3NF?

3NF: 2NF + no nonprime attribute should be functionally dependent on a set of nonprime attributes (= no transitive dependency)

R22(PID, Land, AntalBesökILandet),

R1(PID, PersonNamn):

Yes, a single nonprime attribute, no transitive dependencies.

R21(Land, Kontinent, KontinentYta):

No, Kontinent defines KontinentYta, then

R211(Land, Kontinent)

R212(Kontinent, KontinentYta)

→ R1, R22, R211, R212 are in 3NF

25

### Are R1, R22, R211, R212 in BCNF?

BCNF: Every determinant is a superkey

R22(PID, Land, AntalBesökILandet),

R1(PID, PersonNamn):

R211(Land, Kontinent)

R212(Kontinent, KontinentYta)

→ Yes (**don't be confused by candidate keys!**)

Can the universal relation R be reproduced from R1, R22, R211 and R212 without spurious tuples?

26

## Summary and open issues

- Good design properties of relations
- Functional forms, are = real-world knowledge only be automated
- Are high non-performant when it comes to performance?
  - No, denormalization may be required.

27
