

# TDIU11 Exam

Ahmed Rezine

2018-08-28 08-12

TER4

## Admitted material

Dictionary from English to your chosen language.

## Jour

Ahmed Rezine (013-281938) visiting after about one hour.

## Instructions

- Fill in the exam wrapper and read the instructions on it before you start.  
**Read instructions and all assignments carefully and completely before you begin.**
- You may answer in either English or Swedish.
- State your interpretation of the question and all assumptions you make.
- Write clearly. Unreadable text will be ignored.
- Be precise in your statements. **Prove your point when possible.**  
Ambiguous formulations will lead to reduction of points.
- **Motivate clearly and in depth all statements and reasoning.**  
**Explain calculations and solution procedures.**
- The exam is 40 points and graded U, 3, 4, 5 (**preliminary** limits: 20p, 30p, 35p).  
Points are given for motivations, explanations, and reasoning.

## Definitions

Unless you are more specific, the correcting team will interpret the following terms as follow:

**memory** Volatile random access memory (DRAM), about 100ns access time.

**disk** Permanent storage, about 10ms access time.

**page** A fix size region of virtual memory, possibly on disk.

**frame** A fix size region of physical memory (DRAM).

**block** A data block located on disk.

## Problem 1 (12p)

Assume a paged virtual memory with 16 bits virtual addresses. Each process can address at most 64 pages. Assume single level paging.

1. What is the size in bytes of each single page? (2pt)
2. How large is a single page table if each page entry is a 4 bytes word? (2pt)

Assume in the following physical addresses are 32 bits (i.e., 4 bytes) long. Virtual addresses are still 16 bits long and pages have still the same size as above.

1. How many bits are used in the physical address to identify a frame? (2pt)
2. What is the maximal memory size that can be supported by such a system? (2pt)
3. Is it possible for this system with 16 bits virtual addresses to simultaneously use more than one GiB of memory? (2pt)
4. Suppose the first entries of the page table of some process associate pages to frames according to table (1). What is the physical address (in binary) corresponding to the virtual address  $(0000\ 1000\ 1111\ 1001)_{\text{binary}}$ ? (2pt)

frame bits	valid bit	other bits	
$(0000\ 0000\ 0000\ 0000\ 0010\ 00)_{\text{binary}}$	$(0)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	1 <sup>st</sup> page table entry
$(0000\ 0000\ 0000\ 0000\ 0010\ 01)_{\text{binary}}$	$(1)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	2 <sup>nd</sup> page table entry
$(0000\ 0000\ 0001\ 0001\ 0000\ 00)_{\text{binary}}$	$(1)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	3 <sup>rd</sup> page table entry
$(0000\ 0000\ 0000\ 0001\ 0011\ 00)_{\text{binary}}$	$(1)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	4 <sup>th</sup> page table entry
$(0000\ 0000\ 0010\ 0010\ 0010\ 00)_{\text{binary}}$	$(0)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	5 <sup>th</sup> page table entry
...	...	...	
$(XXXX\ XXXX\ XXXX\ XXXX\ XXXX\ XX)_{\text{binary}}$	$(X)_{\text{binary}}$	$(X\ XXXX\ XXXX)_{\text{binary}}$	n <sup>th</sup> page table entry

Table 1: Some entries of a process page table. The symbol X is used to mean a bit value that is not relevant for the question.

## Problem 2 (4pt)

For each of the following items, state and motivate (in less than 3 sentences) if it is a representative of a capability-based approach or of an ACL-based approach to protection:

1. Each meeting has a list of personally invited guests.
2. Access to some buildings in Campus Valla after 17.00 requires using a personal access card that is presented each time a building is accessed. The card content is compared against the list of students and employees at LiU that may access to the given building.
3. Cars have to have visible parking tickets. The parking tickets can be obtained by using cash to pay the parking fee without entering a registration number or any other identifier.
4. Physical individual room keys can be used to open a student dormitory or a corridor.

Job	Arrival time	Execution time
$J_1$	0	8
$J_2$	1	5
$J_3$	2	3
$J_4$	3	3

Table 2: Workload for problem 3.

### Problem 3 (12p)

Assume an idle system. Consider the workload depicted in table (2).  
First assume an FCFS scheduler.

1. Draw a Gantt diagram for processes' execution and queues' contents. (2pt)
2. What are the individual and the average waiting times? (2pt)

Now assume a preemptive SJF scheduler.

1. Draw a Gantt diagram for processes' execution and queues' contents. (2pt)
2. What are the individual and the average waiting times? (2pt)

General questions about the SJF scheduler algorithm:

1. What is aging in this context and why is it sometimes combined with SJF? (2pt).
2. Assume that the problem aging solves is not an issue. In addition, assume you are willing to pay the price of the increase in the number of context switches that come with SJF. What do you see then as the biggest problem when adopting the SJF scheduling algorithm? how to remedy this? (2pt).

### Problem 4 (8 p)

Assume 28 bits (logical blocks') pointers and a 1TiB (i.e.,  $2^{40}$  bytes) hard drive.

1. Give the minimal size of a logical block. (2pt)
2. Assume 4KiB logical blocks. What is the size of the FAT table with 4 bytes per entry and corresponding to having a single 1TiB volume? recall that FAT is a form of linked allocation but where all links are centralized in a single table for the whole volume. (2pt)
3. Still assuming 4 bytes per FAT entry and a 1TiB volume, how large (in bytes) should a single logical block be in order to obtain a FAT table of 128 MiB (i.e.,  $2^{27}$  bytes) ? (2pt)
4. Compare advantages and disadvantages of the two logical block sizes (i.e, the block sizes adopted/obtained in questions 2 and 3). (2pt)
5. Give two advantages of FAT based allocation over indexed allocation. (2pt)

### Problem 5 (4p)

1. Describe a "dictionary password attack". (2pt)
2. In this context, what is "salt" and how can it help make such an attack harder? (2pt)
