Part I

Introduction, Testing Process

Part I	Part II	Part III	Part IV
Introduction, Testing Process	Unit Testing: Black-box, White-box	Module Testing (Integration testing)	System Testing

Triangle program (simple version)

triangle problem is the most widely used example in software testing literature.

- The program accepts three integers, a , b , and c as input. The three values are interpreted as representing the lengths of sides of a triangle. The program prints a message that states whether the triangle is scalene (oregelbunden), isosceles (likbent) or equilateral (liksidig).
- On a sheet of paper, write a set of test cases (i.e., specific sets of data) that you feel would adequately test this program.

Test case	a	b	c	Expected output
1	3	3	4	isosceles (likbent)
2	?	?	?	?
...				

Part I	Part II	Part III	Part IV
Introduction, Testing Process	Unit Testing: Black-box, White-box	Module Testing (Integration testing)	System Testing

Testing a ballpoint pen

- Does the pen write in the right color, with the right line thickness?
- Is the logo on the pen according to company standards?
- Is it safe to chew on the pen?
- Does the click-mechanism still work after 100 000 clicks?
- Does it still write after a car has run over it?

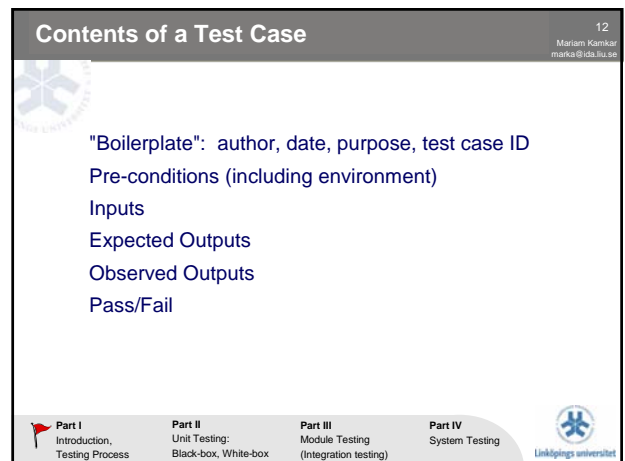

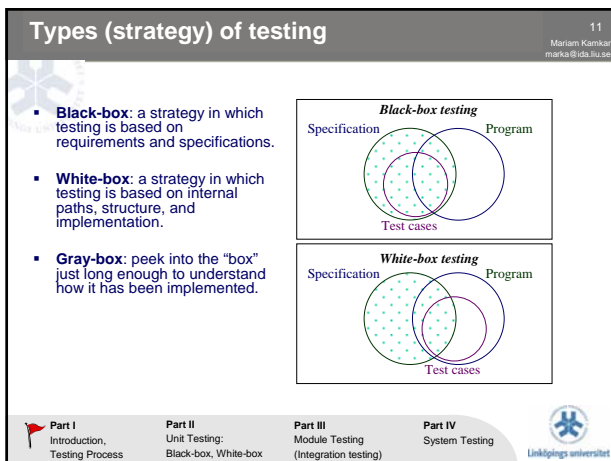

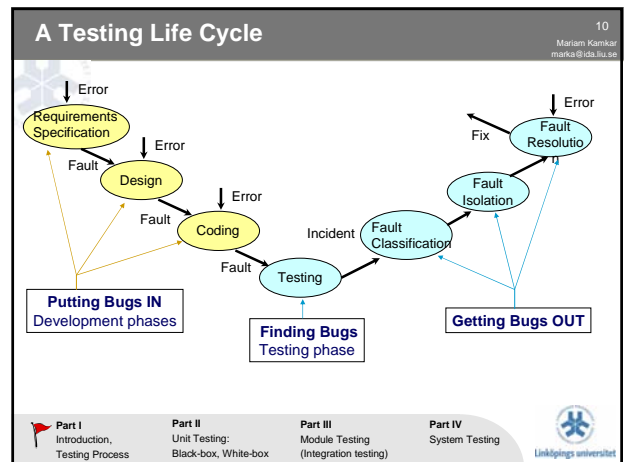

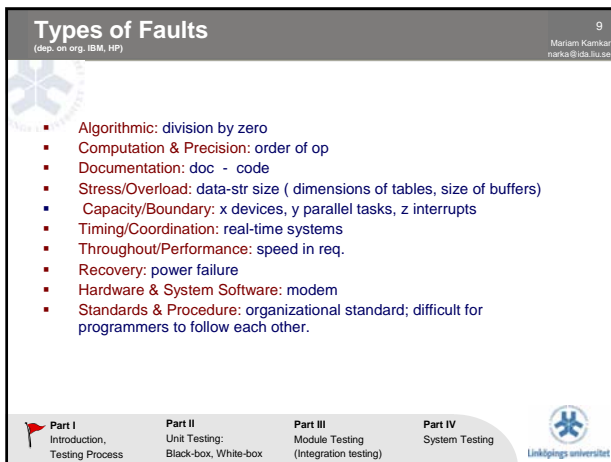

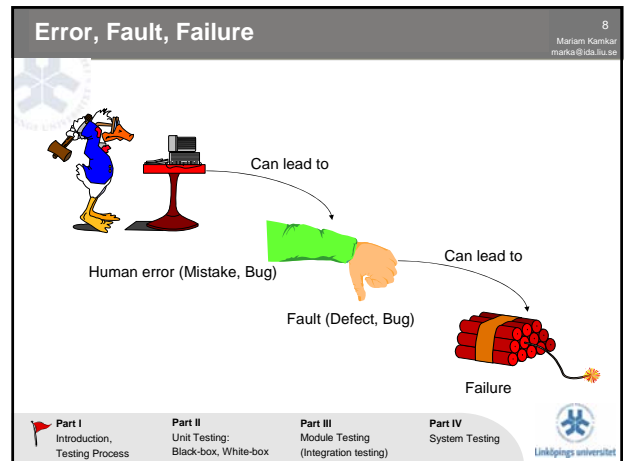

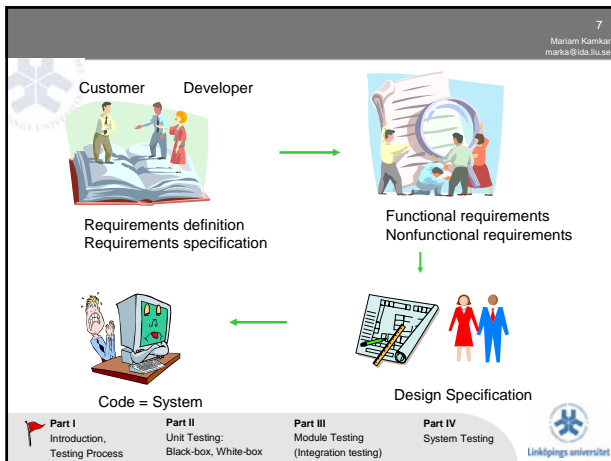

What is expected from this pen?

Intended use!!

Two Types of Oracles

- Human:** an expert that can examine an input and its associated output and determine whether the program delivered the correct output for this particular input.
- Automated:** a system capable of performing the above task.

(Integration testing)

Part IV
System Testing

Block-Box Testing Techniques

21

Mariam Kamkar
marka@ida.liu.se

- **Definition:** a strategy in which testing is based on requirements and specifications.
- **Applicability:** all levels of system development
 - Unit
 - Integration
 - System
 - Acceptance
- **Disadvantages:** never be sure of how much of the system under test (SUT) has been tested.
- **Advantages:** directs tester to choose subsets to tests that are both efficient and effective in finding defects.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

1. Exhaustive testing

22

Mariam Kamkar
marka@ida.liu.se

- **Definition:** testing with every member of the input value space.
- **Input value space:** the set of all possible input values to the program.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

2. Equivalence Class Testing

23

Mariam Kamkar
marka@ida.liu.se

- Equivalence Class (EC) testing is a technique used to reduce the number of test cases to a manageable level while still maintaining reasonable test coverage.
- Each EC consists of a set of data that is treated the same by the module or that should produce the same result. Any data value within a class is **equivalent**, in terms of testing, to any other value.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Identifying the Equivalence Classes

24

Mariam Kamkar
marka@ida.liu.se

Taking each input condition (usually a sentence or phrase in the specification) and partitioning it into two or more groups:

- Input condition
 - range of values x: 1-50
- Valid equivalence class
 - $? < x < ?$
- Invalid equivalence classes
 - $x < ?$
 - $x > ?$

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Guidelines

25

Mariam Kamkar
marka@ida.liu.se

1. If an input condition specifies a *range* of values; identify one valid EC and two invalid EC.
2. If an input condition specifies the *number* (e.g., one through 6 owners can be listed for the automobile); identify one valid EC and two invalid EC (- no owners; - more than 6 owners).
3. If an input condition specifies a set of input values and there is reason to believe that each is handled differently by the program; identify a valid EC for each and one invalid EC.
4. If an input condition specifies a "must be" situation (e.g., first character of the identifier must be a letter); identify one valid EC (it is a letter) and one invalid EC (it is not a letter).
5. If there is any reason to believe that elements in an EC are not handled in an identical manner by the program, split the equivalence class into smaller equivalence classes.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Identifying the Test Cases

26

Mariam Kamkar
marka@ida.liu.se

1. Assign a unique number to each EC.
2. Until all valid ECs have been covered by test cases, write a new test case covering as many of the uncovered valid ECs as possible.
3. Until all invalid ECs have been covered by test cases, write a test case that cover one, and only one, of the uncovered invalid ECs.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Applicability and Limitations

27

Mariam Kamkar
marka@ida.liu.se

- Most suited to systems in which much of the input data takes on values within ranges or within sets.
- It makes the assumption that data in the same EC is, in fact, processed in the same way by the system. The simplest way to validate this assumption is to ask the programmer about their implementation.
- EC testing is equally applicable at the unit, integration, system, and acceptance test levels. All it requires are inputs or outputs that can be partitioned based on the system's requirements.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV

Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Specification: the program accepts four to eight inputs which are 5 digit integers greater than 10000.

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

3. Boundary Value Testing

30

Mariam Kamkar
marka@ida.liu.se

Boundary value testing focuses on the boundaries simply because that is where so many defects hide. The defects can be in the requirements or in the code.

The most efficient way of finding such defects, either in the requirements or the code, is through inspection (Software Inspection, Gilb and Graham's book).

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Technique

31

Mariam Kamkar
marka@ida.liu.se

1. Identify the ECs.
2. Identify the boundaries of each EC.
3. Create test cases for each boundary value by choosing one point on the boundary, one point just below the boundary, and one point just above the boundary.

Part I
Introduction,
Testing Process

Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

4. Decision Table Testing

34

Mariam Kamkar
marka@ida.liu.se

Decision tables are an excellent tool to capture certain kinds of system requirements and to document internal system design. They are used to record complex business rules that a system must implement.

In addition, they can serve as a guide to creating test cases.

Part I
Introduction,
Testing Process

Part II
Unit Testing:

Triangle program (new conditions)

38

Mariam Kamkar
marka@ida.liu.se

The program accepts three integers, a , b , and c as input. The three values are interpreted as representing the lengths of sides of a triangle. The integers a , b , and c must satisfy the following conditions:

- C1: $1 \leq a \leq 200$
- C2: $1 \leq b \leq 200$
- C3: $1 \leq c \leq 200$
- C4: $a < b + c$
- C5: $b < a + c$
- C6: $c < a + b$

What is Wrong with Line Coverage

Steve Cornett (Bullseye testing technology)

Software developers and testers commonly use line coverage because of its simplicity and availability in object code instrumentation technology.

Of all the structural coverage criteria, line coverage is the weakest, indicating the fewest number of test cases.

Bugs can easily occur in the cases that line coverage cannot see.

The most significant shortcoming of line coverage is that it fails to measure whether you test simple if statements with a false decision outcome. Experts generally recommend to only use line coverage if nothing else is available. Any other measure is better.

Path Coverage

52
Mariam Kamkar
marka@ida.liu.se

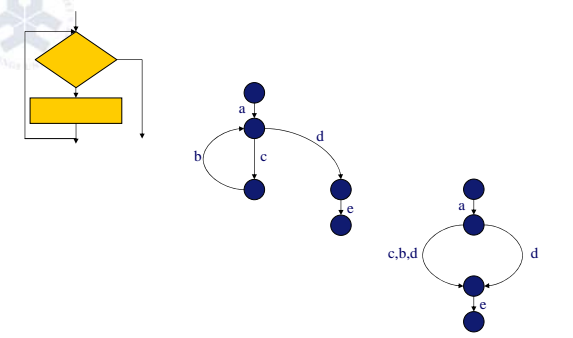

- A path is a sequence of branches, or conditions.
- A path corresponds to a test case, or a set of inputs.
- In code coverage testing, branches have more importance than the blocks they connect.
- Bugs are often sensitive to branches and conditions.

Part I Introduction, Testing Process

Part III Module Testing (Integration testing)
Part IV System Testing

Linköpings universitet

Computation of cyclomatic complexity

55
Mariam Kamkar
marka@ida.liu.se

Cyclomatic complexity has a foundation in graph theory and is computed in the following ways:

1. Cyclomatic complexity $V(G)$, for a flow graph, G , is defined as:

$$V(G) = E - N + 2P$$
 E: number of edges
 N: number of nodes
 P: number of disconnected parts of the graph
2. Cyclomatic complexity $V(G)$, for a flow graph, G , with only binary decisions, is defined as:

$$V(G) = b + 1$$
 b: number of binary decision

Part I Introduction, Testing Process

 Part II Unit Testing: Black-box, White-box
 Part III Module Testing (Integration testing)
 Part IV System Testing
 Linköping universitet

Applicability and Limitation

58
Mariam Kamkar
marka@ida.liu.se

- Control flow testing is the cornerstone of unit testing. It should be used for all modules of code that cannot be tested sufficiently through reviews and inspections.
- Its limitation are that the tester must have sufficient programming skill to understand the code and its control flow.
- Control flow testing can be very time consuming because of all modules and basic paths that comprise a system.

Part I Introduction, Testing Process
 Part II Unit Testing: Black-box, White-box
 Part III Module Testing (Integration testing)
 Part IV System Testing
 Linköping universitet

2. Data Flow Testing

59
Mariam Kamkar
marka@ida.liu.se

Data flow testing focuses on the points at which variables receive values and the points at which these values are used (or referenced). It detects improper use of data values due to coding errors.

Part I Introduction, Testing Process
 Part II Unit Testing: Black-box, White-box
 Part III Module Testing (Integration testing)
 Part IV System Testing
 Linköping universitet

Define/Reference Anomalies

60
Mariam Kamkar
marka@ida.liu.se

- Early data flow analyses often centered on a set of faults that are known as define/reference anomalies.
 - A variable that is defined but never used (referenced)
 - A variable that is used but never defined
 - A variable that is defined twice before it is used

Part I Introduction, Testing Process

Target level B,C,D

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Part IV System Testing

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

- System Testing Steps
 - Function testing / Thread testing
 - Performance testing
 - Acceptance testing
 - Installation testing
- Test Automation
- Termination Problem

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

System Testing

78

Mariam Kamkar
marka@ida.liu.se

Objective: to ensure that the system does what the customer wants it to do.

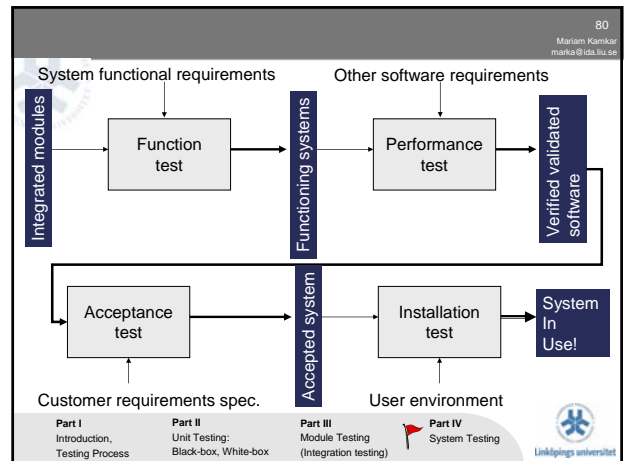

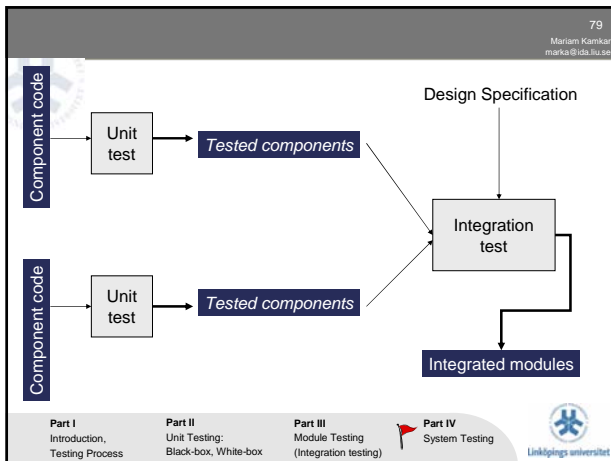

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

81

Function testing/Thread testing

(testing one function at a time)
functional requirements

A function test checks that the integrated system performs its function as specified in the requirement

- Guidelines
 - use a test team independent of the designers and programmers
 - know the expected actions and output
 - test both valid and invalid input
 - never modify the system just to make testing easier
 - have stopping criteria

Part I Introduction, Testing Process
Part II Unit Testing: Black-box, White-box
Part III Module Testing (Integration testing)
Part IV System Testing

Linköping universitet

Cause-and-Effect-Graph (test case generation from req.)

- causes: inputs
- effects: outputs and transformations
- causes-and-effect graph:
 - boolean graph reflecting causes and effects relationships
 - is a formal language into which a natural language specification is translated

Part I Introduction, Testing Process
Part II Unit Testing: Black-box, White-box
Part III Module Testing (Integration testing)
Part IV System Testing

Linköping universitet

Basic cause-effect graph symbols

Identity: if a then b

And: if (a and b) then c

Or: if (a or b or c) then d

Identity: if (not a) then b

Part I Introduction, Testing Process
Part II Unit Testing: Black-box, White-box
Part III Module Testing (Integration testing)
Part IV System Testing

Linköping universitet

84
Mariam Kamkar
marka@ida.ltu.se

Specification: the character in column 1 must be an "A" or a "B". The character in column 2 must be a digit. In this situation, the file update is made. If the first character is incorrect, message X12 is issued. If the second character is not a digit, message X13 is issued.

Causes

C1: character in column 1 is "A"
C2: character in column 1 is "B"
C3: character in column 2 a digit

Effects

E1: update made
E2: message X12 is issued
E3: message X13 is issued

Part I Introduction, Testing Process
Part II Unit Testing: Black-box, White-box
Part III Module Testing (Integration testing)
Part IV System Testing

Linköping universitet

Sample cause-effect graph

85

Mariam Kamkar
marka@ida.liu.se

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Decision table for cause-and effect graph

86

Mariam Kamkar
marka@ida.liu.se

	Test 1	Test 2	Test 3	Test 4
Cause 1	1	0	0	X
Cause 2	0	1	0	X
Cause 3	1	1	X	0
Effect E1	1	1	0	0
Effect E2	0	0	1	0
Effect E3	0	0	0	1

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Performance Testing nonfunctional requirements

87

Mariam Kamkar
marka@ida.liu.se

- Stress tests
- Volume tests
- Configuration tests
- Compatibility tests
- Regression tests
- Security tests
- Timing tests
- Environment tests
- Quality tests
- Recovery tests
- Maintenance tests
- Documentation tests
- Human factors tests / usability tests

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Acceptance Testing customers, users need

88

Mariam Kamkar
marka@ida.liu.se

- Benchmark test: a set of special test cases
- Pilot test: everyday working
 - Alpha test: at the developer's site, controlled environment
 - Beta test: at one or more customer site.
- Parallel test: new system in parallel with previous one

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Installation Testing users site

89

Mariam Kamkar
marka@ida.liu.se

Acceptance test at developers site
→ installation test at users site,
otherwise may not be needed!!

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Test Automation

90

Mariam Kamkar
marka@ida.liu.se

- Automating parts of the testing process can provide long-term benefits to organization, such as:
 - reducing the amount of time it takes to execute a suite of tests
 - reducing the tester's involvement in executing tests
 - facilitating regression testing
 - allowing for the simulation of hundreds of users
 - avoiding human mistakes by having tools control repetitive and tedious tasks
- Test automation refers to two key testing activities:
 - Executing the tests
 - Evaluating the output

Part I
Introduction,
Testing Process

Part II
Unit Testing:
Black-box, White-box

Part III
Module Testing
(Integration testing)

Part IV
System Testing

Automated Testing Tools

91
Mariam Kamkar
marka@ida.liu.se

- Code Analysis tools
 - Static, Dynamic
- Test execution tools
 - Capture-and-Replay
 - Stubs & Drivers
 - Comparators
- Test case generator

Part I Introduction, Testing Process Part II Unit Testing: Black-box, White-box Part III Module Testing (Integration testing) **Part IV System Testing**

Linköping universitet

Termination Problem

How decide when to stop testing

92
Mariam Kamkar
marka@ida.liu.se

- The main problem for managers!
- Termination takes place when
 - resources (time & budget) are over
 - found the seeded faults
 - some coverage is reached

Part I Introduction, Testing Process Part II Unit Testing: Black-box, White-box Part III Module Testing (Integration testing) **Part IV System Testing**

Linköping universitet

Summary - What have we learned today? (1/2)

93
Mariam Kamkar
marka@ida.liu.se

Part I: Introduction, Testing process

Part II: Unit Testing:

- Black-box Testing
 - Exhaustive testing
 - Equivalence class testing (Equivalence Partitioning)
 - Boundary value analysis
 - Decision table testing
- White-box Testing
 - Control Flow Testing
 - Statement/Line/Basic block/Segment Coverage
 - Decision (Branch) Coverage
 - Condition Coverage
 - Decision/Condition Coverage
 - Path Coverage
 - Data Flow Testing

Part I Introduction, Testing Process Part II Unit Testing: Black-box, White-box Part III Module Testing (Integration testing) **Part IV System Testing**

Linköping universitet

Summary - What have we learned today? (2/2)

94
Mariam Kamkar
marka@ida.liu.se

Part III: Module Testing (Integration Testing)

- Top-down
- Bottom-up
- Big-bang
- Sandwich

Part IV: System Testing
