The following document describes how to install the RWG implementation and the RWGChat application in compatible Symbian phones.

RWG protocol and RWG Chat – Install the protocol and the application

In order to install the protocol and the chat application you can proceed in two different ways.

1. Nokia PC Suite:
    a. Connect your phone to your computer and run the Nokia PC Suite.
    b. Double-click in the RWGSymbian and RWGChat sisx files.
    c. Continue the installation in the phone
2. Directly from the phone:
    a. Download RWGSymbian and RWGChat files to your phone and execute the installation directly from your phone clicking them.

Needed additional software – Qt and Open C plug-in installation

In order to run the protocol and the chat application in older phones you will have to install additional packages. You have to verify if your phone has already any pre-installed Qt version. This information can be found in the following link:

http://www.forum.nokia.com/Devices/

Otherwise, before running the application and the protocol you will have to install Qt and the Open C plug-in in your phone.

Network connection – Create the rwg ad hoc network connection

In order to use the protocol you will have to create the "rwg" ad hoc network in your phone. This can be easily done creating a WLAN access point in ad hoc mode from *Menu > Settings > Connectivity > Destinations > Access point* or using the WLAN Wizard from *Menu > Settings > Connectivity > WLAN*. Check the manual of the phone if you have any doubt of how to proceed.
