## Algorithmic Problem Solving Le 8 Strings II

Herman Appelgren
Dept of Computer and Information Science Linköping University

## Outline

- Exercise 8: Strings I
- A: Exercise Evil Straw Warts Live
"-B: Dictionary Attack
-B: Dominant Strings
=-C: Intellectual Property
- Suffix Trie \& Suffix Tree
- Suffix Array (Lab 3.2)
- Construction (Lab 3.2)
- Longest Common Prefix extension (Lab 3.3)

## Repetition from last lecture

- Suffixes are substrings at the end of the string.
- Example: "banana" (not proper), "anana", "nana", "ana", "na", "a", "".
- Prefixes are substring at the start of the string.
- Example: "banana" (not proper), "banan", "bana", "ban", "ba", "b"، "".
- A Trie is a rooted tree structure used for storing a set of strings and optimize prefix searches.

## Suffix Trie

A suffix trie is a trie built for all suffixes of a set of strings

- Check whether $S$ is a substring of $T$.
- Follow the path for S from the root.
- If you exhaust $S$, then $S$ is in $T$.
- Check whether $S$ is a suffix of $T$.
- Follow the path for $S$ from the root.
- If you end at a leaf at the end of $S$, then $S$ is a suffix of $T$.
- Count \# of occurrences of S in T.
- Follow the path for S from the root.
- The result is the sum of the \# of suffixes represented by the leaves under the node you end up in.

## Suffix Trie vs Suffix Tree

- Suffix Tree improves Suffix Trie by compressing internal nodes.
- Suffix Tries are easy to construct, Suffix Trees not so much...

0

(1)

## Suffix Tree

- String Multimatching in $\mathrm{O}\left(|\mathrm{P}|+\mathrm{n} \_\right.$matches $)$
- The matches are contained in the leaves in the subtree rooted at the node representing the pattern.
- Longest Repeated Substring in $\mathrm{O}(|\mathrm{T}|)$
- Find the deepest internal node.
- Longest Common Substring in $\mathrm{O}(|\mathrm{T}|)$
- Find the deepest internal node with leaves from both strings.

## Suffix Array (Lab 3.2)

- The Suffix Array is a sorted array of all suffixes of a string.
- Solves most problems Suffix Trees does with comparable time complexity.
- Much easier to implement (but still far from trivial).
- One of the most important data structures in this course!

|  | i | Suffix |  | i | SA[i] | Suffix |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | O | abcabcaaa |  | o | 8 | a |
|  | 1 | bcabcaaa |  | 1 | 7 | aa |
| - $\mathrm{SA}[\mathrm{i}]=$ starting index of suffix i in sorted order. | 2 | cabcaaa |  | 2 | 6 | aaa |
| - Don't store the suffixes explicitly! | 3 | abcaaa | Sort => | 3 | 3 | abcaaa |
| - Copying would take $\left.O\left(n^{\wedge}\right)^{2}\right)$ time and memory. | 4 | bcaaa |  | 4 | O | abcabcaaa |
| - Store single copy of S, extract | 5 | caaa |  | 5 | 4 | bcaaa |
|  | 6 | aaa |  | 6 | 1 | bcabcaaa |
|  | 7 | aa |  | 7 | 5 | caaa |
|  | 8 | a |  | 8 | 2 | cabcaaa |

## Suffix Array - String Matching

- String Matching: Find all occurences of P in T.
- Create Suffix Array of T.
- Use binary search to find first and last suffix that starts with $P$.
- 2 binary searches, each comparison takes at most $\mathrm{O}(|\mathrm{P}|)=\mathrm{O}(|\mathrm{P}| \log |\mathrm{T}|)$.
" Example: $\mathrm{T}=$ "abcabcaaa" and $\mathrm{P}=$ " ab " or $\mathrm{P}=$ "ac".

| i | SA[i] | Suffix | SA[i] | Suffix |
| :---: | :---: | :---: | :---: | :---: |
| o | 8 | a | 8 | a |
| 1 | 7 | aa | 7 | aa |
| 2 | 6 | aaa | 6 | aaa |
| 3 | 3 | abcaaa | 3 | abcaaa |
| 4 | 0 | abcabcaaa | o | abcabcaaa |
| 5 | 4 | bcaaa | 4 | bcaaa |
| 6 | 1 | bcabcaaa | 1 | bcabcaaa |
| 7 | 5 | caaa | 5 | caaa |
| 8 | 2 | cabcaaa | 2 | cabcaaa |

## Suffix Array - Construction

- Naive implementation
- Standard sort by comparing suffixes.
- Time complexity in $\mathrm{O}\left(\mathrm{N}^{\wedge}{ }^{2} \log \mathrm{~N}\right)$, since comparisons take $\mathrm{O}(\mathrm{N})$.
- Not feasible even for moderately large strings!

```
#include <algorithm>
#include <cstdio>
#include <cstring>
using namespace std;
char T[MAX_N]; int SA[MAX_N];
bool cmp(int a, int b) { return strcmp(T + a, T + b) < 0; }
int main() {
    int n = (int)strlen(gets(T));
    for (int i = 0; i < n; i++) SA[i] = i;
    sort (SA, SA + n, cmp); What is the time complexity?
}
        Overall O(N2 log
```

```
                                    This is O(N)
```

```
                                    This is O(N)
```

## Suffix Array - Construction

- Idea: Sort multiple times, comparing only parts of the string.
- In iteration k , only compare the first $2^{\wedge} \mathrm{k}$ characters.
- Reuse results to avoid increasing work between iterations.
- Sort suffixes lexicographically based on C1 and C2.
- Iteration 1 : Set $\mathrm{C}_{1}[\mathrm{i}]$ and $\mathrm{C}_{2}[\mathrm{i}]$ to ASCII values of first two chars.

| 1 | SA[i] | Suffix | $\mathrm{C}_{1}$ [1] | C2[i] |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | abcabcaaa | 97 | 98 |
| 1 | 1 | bcabcaaa | 98 | 99 |
| 2 | 2 | cabcaaa | 99 | 97 |
| 3 | 3 | abcaaa | 97 | 98 |
| 4 | 4 | bcaaa | 98 | 99 |
| 5 | 5 | caaa | 99 | 97 |
| 6 | 6 | aaa | 97 | 97 |
| 7 | 7 | aa | 97 | 97 |
| 8 | 8 | a | 97 | O |

| i | SA[i] | Suffix | $\mathrm{Cl}_{1}$ [1] | $\mathrm{C}_{2}[1]$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 8 | a | 97 | 0 |
| 1 | 6 | aaa | 97 | 97 |
| 2 | 7 | aa | 97 | 97 |
| 3 | o | abcabcaaa | 97 | 98 |
| 4 | 3 | abcaaa | 97 | 98 |
| 5 | 1 | bcabcaaa | 98 | 99 |
| 6 | 4 | bcaaa | 98 | 99 |
| 7 | 2 | cabcaaa | 99 | 97 |
| 8 | 5 | caaa | 99 | 97 |

## Suffix Array - Construction

- Iteration 2: Sort by the first four characters.
- We already know the relative order of the second pair of characters from each suffix, since they are the first two characters of another suffix!
- $\mathrm{C}_{1}[\mathrm{i}]=$ rank of suffix starting at $\mathrm{SA}[\mathrm{i}]$.
- $\mathrm{C}_{2}[\mathrm{i}]=$ rank of suffix starting at $\mathrm{SA}[\mathrm{i}]+2$, or o if $\mathrm{SA}[\mathrm{i}]+2>=\mathrm{n}$.

## Suffix Array - Construction

- Sort based on new $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$.

| i | SA[i] | Suffix | $\mathrm{C}_{1}[\mathrm{i}]$ | $\mathrm{C}_{2}[\mathrm{i}]$ |
| :--- | :---: | :--- | :---: | :---: |
| o | 8 | a | $\mathbf{1}$ | o |
| $\mathbf{1}$ | 6 | aaa | 2 | $\mathbf{1}$ |
| $\mathbf{2}$ | 7 | aa | 2 | o |
| 3 | o | abcabcaaa | 3 | 5 |
| 4 | 3 | abcaaa | 3 | 5 |
| 5 | $\mathbf{1}$ | bcabcaaa | 4 | 3 |
| 6 | 4 | bcaaa | 4 | 2 |
| 7 | 2 | cabcaaa | 5 | 4 |
| 8 | 5 | caaa | 5 | 2 |

## Suffix Array - Construction

- Iteration 3: Sort by the first eight character.
- Update $C_{1}$ and $C_{2}$ in the same way, but now with step length 4.

## Suffix Array - Construction

- Sort based on new $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$.

| i | SA[i] | Suffix | $\mathrm{C}_{1}[\mathbf{i}]$ | $\mathrm{C}_{2}[\mathrm{i}]$ |
| :--- | :---: | :--- | :---: | :---: |
| o | 8 | a | $\mathbf{1}$ | o |
| $\mathbf{1}$ | 7 | aa | 2 | o |
| $\mathbf{2}$ | 6 | aaa | 3 | o |
| 3 | o | abcabcaaa | 4 | 5 |
| 4 | 3 | abcaaa | 4 | 2 |
| 5 | 4 | bcaaa | 5 | $\mathbf{1}$ |
| 6 | $\mathbf{1}$ | bcabcaaa | 6 | 7 |
| 7 | 5 | caaa | 7 | o |
| 8 | 2 | cbacaaa | 8 | 3 |

| i | SA[1] | Suffix | $\mathrm{C}_{1}$ [1] | $\mathrm{C}_{2}[1]$ |
| :---: | :---: | :---: | :---: | :---: |
| o | 8 | a | 1 | o |
| 1 | 7 | aa | 2 | o |
| 2 | 6 | aaa | 3 | o |
| 3 | 3 | abcaaa | 4 | 2 |
| 4 | o | abcabcaaa | 4 | 5 |
| 5 | 4 | bcaaa | 5 | 1 |
| 6 | 1 | bcabcaaa | 6 | 7 |
| 7 | 5 | caaa | 7 | o |
| 8 | 2 | cbacaaa | 8 | 3 |

## Suffix Array - Construction

27

- Iteration 4: Sort by first sixteen characters (i.e. entire string).
- Update C1 and C2 with step length 8
- All strings have unique C 1 , so we terminate without sorting.

| i | SA[i] | Suffix | $\mathrm{C}_{1}[\mathbf{i}]$ | $\mathrm{C}_{2}[\mathbf{i}]$ |
| :--- | :---: | :--- | :---: | :---: |
| o | 8 | a | o |  |
| $\mathbf{1}$ | 7 | aa | $\mathbf{2}$ | o |
| $\mathbf{2}$ | 6 | aaa | 3 | o |
| 3 | 3 | abcaaa | 4 | 2 |
| 4 | o | abcabcaaa | 4 | 5 |
| $\mathbf{5}$ | 4 | bcaaa | 5 | $\mathbf{1}$ |
| 6 | $\mathbf{1}$ | bcabcaaa | 6 | 7 |
| 7 | 5 | caaa | 7 | o |
| 8 | $\mathbf{2}$ | cbacaaa | 8 | 3 |

| i | SA[1] | Suffix | C1[1] | C2[1] |
| :---: | :---: | :---: | :---: | :---: |
| o | 8 | a | 1 | o |
| 1 | 7 | aa | 2 | o |
| 2 | 6 | aaa | 3 | o |
| 3 | 3 | abcaaa | 4 | o |
| 4 | o | abcabcaaa | 5 | 1 |
| 5 | 4 | bcaaa | 6 | o |
| 6 | 1 | bcabcaaa | 7 | o |
| 7 | 5 | caaa | 8 | o |
| 8 | 2 | cbacaaa | 9 | o |

## Suffix Array - Construction

- Time complexity
- At most O(logn) iterations needed.
- With comparison based sort, total time complexity is $\left.\mathrm{O}\left(\mathrm{n}(\operatorname{logn})^{\wedge}\right)_{2}\right)$.
- Improvement: Both C1 and C2 are integers, so we can use integer-specific sorting algorithms!

## Integer Sorting

- Counting Sort of single integers
- Let count $[\mathrm{i}]=$ number of elements with value $i$.
- Then, elements with value i should be placed on indicies [sum(count[ $\mathrm{j}<$ i]), sum( $\operatorname{count}[j<=i])$ ) in sorted order.

```
vector<int> countingsorg(const vector<int>& v) {
    int m = *max_element(v.begin(), v.end());
    vector<int> count (m + 1, 0);
    for (int val : v) ++count[va1];
    vector<int> idx(m + 1, 0);
    for (int i = 1; i < count.size(); ++i) {
    idx[i] = idx[i - 1] + count[i - 1];
    }
    vector<int> res(v.size());
    for (int val : v) {
        res[idx[va1]] = val;
        ++idx[va1];
    }
    return res;
```

## Integer Sorting

- Radix Sort of integer tuples.
- Counting Sort is stable.
- To sort the tuples lexicographically, first sort the last integer using Counting Sort, then the second to last, ...

| $\mathrm{C}_{1}[\mathrm{i}]$ | $\mathrm{C}_{2}[\mathrm{i}]$ |
| :---: | :---: |
| 1 | o |
| 2 | 1 |
| 2 | o |
| 3 | 5 |
| 3 | 5 |
| 4 | 4 |
| 4 | 2 |
| 5 | 4 |
| 5 | 2 |

| $\mathrm{C}_{1}[\mathrm{i}]$ | $\mathrm{C}_{2}[\mathrm{i}]$ |
| :---: | :---: |
| 1 | o |
| 2 | o |
| 2 | 1 |
| 4 | 2 |
| 5 | 2 |
| 4 | 4 |
| 5 | 4 |
| 3 | 5 |
| 3 | 5 |

| $\mathrm{C}_{1}[\mathrm{i}]$ | $\mathrm{C}_{2}[\mathrm{i}]$ |
| :---: | :---: |
| 1 | 0 |
| 2 | 0 |
| 2 | 1 |
| 3 | 5 |
| 3 | 5 |
| 4 | 2 |
| 4 | 4 |
| 5 | 2 |
| 5 | 4 |

## Suffix Array - Construction

- Suffix Array in O(n^2logn)
- Naïve construction by direct comparison of suffixes.
- Useful baseline, but no course credits.
- Suffix Array in $\mathrm{O}\left(\mathrm{n}(\log n)^{\wedge}{ }_{2}\right)$
- Comparison-based sorting algorithm operating on bigrams.
- Sufficient for course credits, but might need optimization to pass time limits, especially for exercises/sessions.
- Suffix Array in O(nlogn)
- Radix sort of bigrams.
- Solves all relevant course problems handily.
- Suffix Array in O(n)
- Interesting if you want a challenge. Ask Leif for directions.
- Suffix Tree in O(n)
- Very challenging, but doable. See e.g. Ukkonen's algorithm.

## Suffix Array - Implementation

- There are multiple arrays of indices with different meaning. Make sure you understand their purpose!
- Troubleshooting advice
- Most bugs arise when comparing suffixes towards the end of the text.
- To troubleshoot, print the array on a nice format, e.g. the one used in the previous slides. Makes it easy to manually check correctness.
- Good testcases are strings with repeating subpatterns, but natural sentences are often sufficient.
- Some implementations append a terminating character
- Removes some special cases, since all "real" suffixes then has a preceding entry in the table
- Might make other parts of the code less intuitive.

## Suffix Array - Longest Common Prefix (Lab 3.3)

- To solve many Suffix Array problems, we need the Longest Common Prefix extension.
- LCP[i] is the length of longest prefix shared between SA[i] and SA[i-1].

| i | SA[i] | LCP[i] | Suffix |
| :--- | :---: | :---: | :--- |
| o | 6 | o | aab |
| $\mathbf{1}$ | 7 | 1 | $\underline{\text { ab }}$ |
| 2 | 3 | 2 | $\underline{\text { abcaab }}$ |
| 3 | o | 4 | $\underline{\text { abcabcaab }}$ |
| 4 | 8 | o | b |
| 5 | 4 | 1 | $\underline{\text { b caab }}$ |
| 6 | 1 | 3 | $\underline{\text { bcabcaab }}$ |
| 7 | 5 | o | caab |
| 8 | 2 | 2 | cabcaab |

## Suffix Array - Longest Repeated Substring

- Find the longest substring that occurs at least twice in the text.
- Recall: Every substring is a prefix of a suffix.
- The longest repeated substring is simply the largest LCP entry.

| i | SA[i] | LCP[i] | Suffix |
| :--- | :---: | :---: | :--- |
| o | 6 | o | aab |
| $\mathbf{1}$ | 7 | $\mathbf{1}$ | ab |
| 2 | 3 | 2 | abcaab |
| 3 | o | 4 | abcabcaab |
| 4 | 8 | o | b |
| 5 | 4 | $\mathbf{1}$ | bcaab |
| 6 | 1 | 3 | bcabcaab |
| 7 | 5 | o | caab |
| 8 | 2 | 2 | cabcaab |

## Suffix Array - Longest Common Substring

- Find the longest substring contained in both T1 and T2.
- Concatenate the strings, separated by a character not contained in $\mathrm{T}_{1}$ or $\mathrm{T}_{2}$.
- Find the largest LCP value corresponding to a prefix from different texts.
- Example: "abcabca" and "aabcb"

| owner | LCP | Suffix |
| :---: | :---: | :---: |
| T1 | o | \#aabcb |
| T1 | o | a\#aabcb |
| T2 | 1 | aabcb |
| T1 | 1 | abca\#aabcb |
| Ti | 4 | abcabca\#aabcb |
| T2 | 3 | abcb |
| T2 | o | b |
| Ti | 1 | bca\#aabcb |
| T1 | 3 | bcabca\#aabcb |
| T2 | 2 | bcb |
| Ti | o | ca\#aabcb |
| Ti | 2 | cabca\#aabcb |
| T2 | 1 | cb |

## Suffix Array - Longest Common Substring

- Generalizes to more than two texts.
- Concatenate the texts.
- Don't count the separators towards LCP, or use unique separators!
- If $m$ is the smallest LCP value in a range corresponding to suffixes from all texts, then there is a common substring of length m .
- Find the largest such m.
" Example: "ab", "abc", "a", "aaab"

| owner | LCP | Suffix |
| :---: | :---: | :---: |
| T2 | o | \#a\#aaab |
| T3 | O | \#aaab |
| T1 | o | \#abc\#a\#aaab |
| T3 | O | ä\#aaab |
| T4 | 1 | ąaab |
| T4 | 2 | a ab |
| T4 | 1 | $\underline{\text { ab }}$ |
| T1 | 2 | ab\#abc\#a\#aaab |
| T2 | 2 | abc\#a\#aaab |
| T4 | O | b |
| T1 | 1 | b\#abc\#a\#aaab |
| T2 | 1 | bc\#a\#aaab |
| T2 | o | c\#a\#aaab |

## Suffix Array - Computing LCP

- The naïve algorithm (comparing each suffix pair) is quadratic, which is unacceptably slow!
- It is actually easier to compute LCP in unsorted order.
- Note that in this order, LCP never decreases by more than one.
- Thus, when computing LCP[i], we can start at LCP [i-1]-1.
- Since LCP decrements at most once per suffix and cannot exceed $n$, this reduces the time complexity to $\mathrm{O}(\mathrm{n})$.

| i | SA[i] | LCP[i] | Suffix |
| :--- | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 1 | abcaab |
| 5 | 4 | o | bcaab |
| 7 | 5 | o | caab |
| o | 6 | o | aab |
| 1 | 7 | 1 | ab |
| 4 | 8 | o | b |

## Suffix Array - Computing LCP

The first suffix has index 3 in sorted order. The second suffix has index 6 Find index $2(\mathrm{O}(1)$ if precomputed in $\mathrm{O}(\mathrm{n})$ ) Find index 5 First 4 characters match.

No need to recheck first 3 characters

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 |  | bcabcaab |
| 8 | 2 |  | cabcaab |
| 2 | 3 |  | abcaab |
| 5 | 4 |  | bcaab |
| 7 | 5 |  | caab |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 |  | cabcaab |
| 2 | 3 |  | abcaab |
| 5 | 4 |  | bcaabb |
| 7 | 5 |  | caab |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

## Suffix Array - Computing LCP

The third suffix has index 8 in sorted order The fourth suffix has index 2 Find index 7
No need to recheck first 2 characters

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 |  | abcaab |
| 5 | 4 |  | bcaab |
| 7 | 5 |  | caabb |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 |  | bcaab |
| 7 | 5 |  | caab |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

## Suffix Array - Computing LCP

The fifth suffix has index 5 in sorted order Find index 4
No need to check first character

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 | 1 | bcaab |
| 7 | 5 |  | caab |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | $\mathbf{1}$ | 3 | $\underline{\text { b }}$ cabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 | $\mathbf{1}$ | bcaab |
| 7 | 5 | o | $\underline{\text { caab }}$ |
| o | 6 |  | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

## Suffix Array - Computing LCP

The 7th suffix has index o in sorted order
Has no preceeding suffix, so LCP $=0$

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 | 1 | bcaab |
| 7 | 5 | o | caab |
| o | 6 | o | aab |
| $\mathbf{1}$ | 7 |  | ab |
| 4 | 8 |  | b |

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | 0 | 4 | abcabcaab |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 | 1 | bcaab |
| 7 | 5 | o | caab |
| o | 6 | o | $\underline{\text { aab }}$ |
| $\mathbf{1}$ | 7 | 1 | $\underline{\text { ab }}$ |
| 4 | 8 |  | b |

## Suffix Array - Computing LCP

Change to sorted suffix order

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| 3 | o | 4 | $\underline{\text { abbcabcaab }}$ |
| 6 | 1 | 3 | bcabcaab |
| 8 | 2 | 2 | cabcaab |
| 2 | 3 | 2 | abcaab |
| 5 | 4 | 1 | bcaab |
| 7 | 5 | o | caab |
| o | 6 | o | aab |
| 1 | 7 | 1 | ab |
| 4 | 8 | o | $\underline{\mathrm{b}}$ |

| $\mathbf{i}$ | SA[i] | LCP[i] | Suffix |
| :---: | :---: | :---: | :--- |
| o | 6 | o | aab |
| $\mathbf{1}$ | 7 | 1 | ab |
| 2 | 3 | 2 | abcaab |
| 3 | o | 4 | abcabcaab |
| 4 | 8 | o | b |
