Component-Based Software

Model-Driven Architecture (MDA)

Literature:

- A. Kleppe, J. Warmer, W. Bast:
MDA Explained: The Model Driven Architecture (TM): Practice and Promise. Addison-Wesley, 2003. Available for students as electronic copy in Kvarterbibliotek B.
- S. Mellor, K. Scott, A. Uhl, D. Weise:
MDA Distilled – Principles of Model-Driven Architecture. Addison-Wesley, 2004.
- OMG: www.omg.org/mda

Christoph Kessler, IDA,
Linköpings universitet.

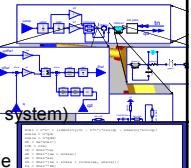

Model

- Set of elements that describes some physical, abstract, or hypothetical **system**
 - Abstraction from one or several properties
 - ▶ E.g., real size, material, level of detail
 - Means of communication
 - Cheaper to build than the real system
 - More suitable for analysis (e.g., by static analysis or simulation) than the real system
 - Decision help

Examples:

- Modelica models for physical/technical systems
- UML model = abstraction of a program (software system)
 - ▶ Level of detail can vary
 - from coarse-grained blocks to executable code

C. Kessler, IDA, Linköpings universitet.

2

Relations between model and code

Code only Code visualization Roundtrip engineering Model-centric

MDA idea:
Generate the system from the model!!

C. Kessler, IDA, Linköpings universitet.

Mapping between models

- **MDA:** Iterative and incremental development by *successive model refinement*, up to code generation
- **Mapping:**

Source model (e.g. UML model)
 Target model (e.g. Java code)
 mapping function
 Described at the metamodel level
 Applicable to all source models that conform to the metamodel

- Can be automated by providing an executable specification
- In full generality not completely automatizable
 - ▶ UML only semi-formal, not really executable
 - ▶ Needs manual editing for complementation

C. Kessler, IDA, Linköpings universitet.

Platform

- Specification of an execution environment for a set of models
 - E.g.: CORBA, EJB; Java JVM, C++; Linux, Solaris, Windows, RTOS; SPARC, IA-64, PowerPC; VHDL; ...
- Needs to have at least one implementation
 - ▶ Which can build upon one or more other platforms (composed realization)
 - ▶ Or stand alone (primitive realization)

C. Kessler, IDA, Linköpings universitet.

4

PIM, PSM

- **PIM** (Platform-independent model)
 - business-oriented,
 - Abstracts from platform issues
 - survives change of platform
- **PSM** (Platform-specific model)
 - contains platform specific modeling elements, types etc.
- Can be iterated
- Code generation from last PSM

PIM
 Model transformation and elaboration
 PSM1
 Model transformation and elaboration
 PSM2
 (source) code

C. Kessler, IDA, Linköpings universitet.

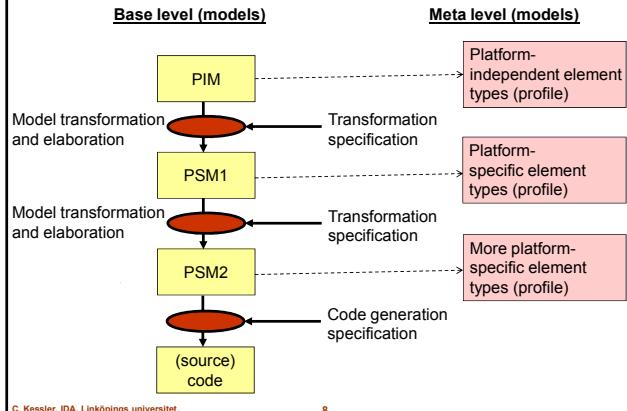

UML Profiles

- Collection of stereotypes and metamodel extensions for a special domain or platform
 - Creates an UML dialect
 - Needs standardization
- Examples:
 - UML Real-time profile
 - UML profile for CORBA

C. Kessler, IDA, Linköpings universitet.

7

PIM, PSM, Model transformations

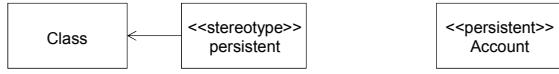

8

Background: Customizing UML

- E.g., to construct MDA marking models

Two UML Extension Mechanisms:

- **Stereotypes**
= Type qualifiers to customize existing language elements (e.g., classes, associations)
 - Example: Definition and use of stereotype <<persistent>>:

- **MOF**

Can also introduce new graphical symbols in both cases

C. Kessler, IDA, Linköpings universitet.

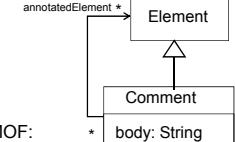

9

Background: MOF (Meta-Object Facility)

- MOF = the language in which UML is specified
- A subset of UML itself: (→ reified)
 - Types (classes, primitives, types, enumerations)
 - Generalizations (inheritance)
 - Attributes
 - Associations
 - Operations
- Example: Definition of a UML comment in MOF:

```

graph TD
    Element[Element] -- "*" --> Comment[Comment]
    Comment -- "*" --> body[body: String]
    
```
- MOF specifies only structural and behavioral aspects
 - Not how to store, graphically represent, or edit UML models – left to tool providers
 - Except for an XML-based metadata interchange format: XMI
- Use MOF for fundamental extensions of the UML language

Marking models

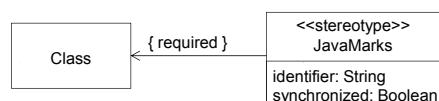

- **Marks**
= light-weight, non-intrusive, persistent extensions to models that capture information required for model transformations without polluting these models
 - "sticky notes" attached to model elements
 - Specific to a mapping
- in UML?
 - Hungarian notation for special class names etc.
 - Special elements defined by a **marking model** (specified as UML extension)

C. Kessler, IDA, Linköpings universitet.

11

Marking model example

- Definition of a mark element with attributes
 - Example: as a stereotype of the Class metaclass

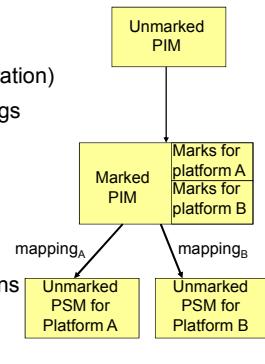

C. Kessler, IDA, Linköpings universitet.

12

Using marking models to guide model transformations and code generation

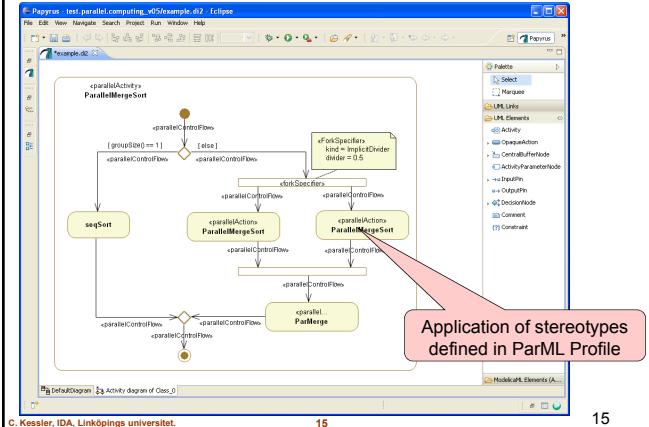

- PSM created from a marked PIM by mapping + manual complementation (elaboration)
 - Marking a PIM for different mappings leads to different PSM's
 - The marking is added manually (eg. using a special UML editor)
 - The marking serves as possible anchor points (cf. declared hooks) for automated model transformations
 - This process can be iterated
 - Code generation from last PSM

C. Kessler, IDA, Linköpings universitet

13

Using the Papyrus UML Tool as Editor

C. Kessler, IDA, Linköpings universitet.

15

Source code generation with templates (boilerplates, code skeletons)

Example: Velocity <http://velocity.apache.org>

- Velocity Template Language (for static metaprogramming)
 - Generate Java source code from Java-PSM in UML

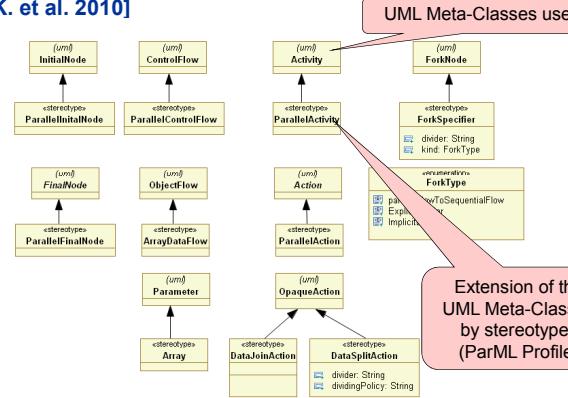

```
  $classModifiers ( $class ) class $class.name {  
    #foreach ( $field in $class.fields )  
      #fieldModifiers ( $field ) $field.type.name $field  
    #end  
    #foreach ( $constructor in $class.constructors )  
      #constructorModifiers ( $constructor ) $constructor  
    #end  
    #foreach ( $method in $class.methods )  
      #methodModifiers ( $method ) $method.type.name $method  
    #end  
  }
```

Example template
in Velocity,
generating a simple
Java class

C. Kessier, IDA, Linköpings universitet

14

Example: ParML – a UML profile for modeling explicitly parallel computations [K. et al. 2010]

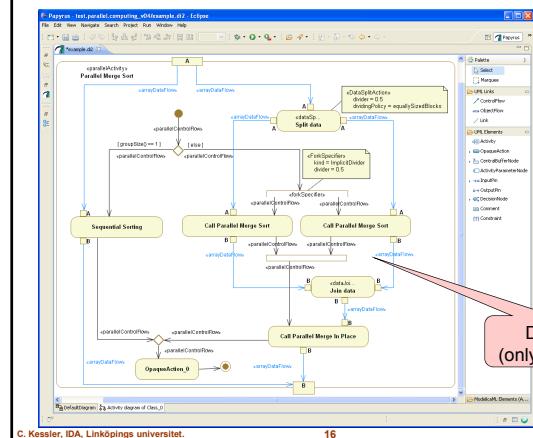

G. Kessler, IDA, Linköpings universitet

1

14

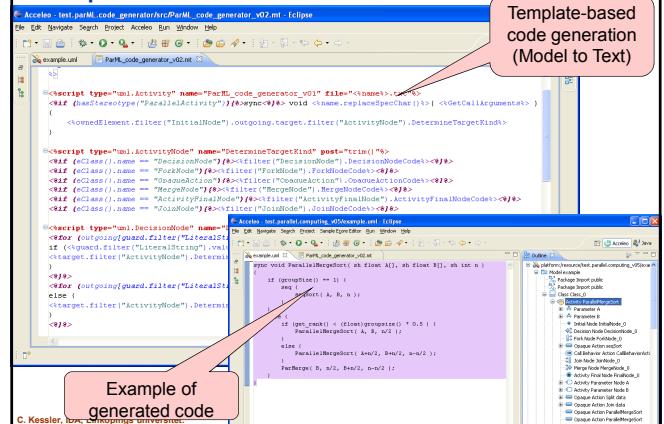

ParML Example: Control- and Data-Flow

[K. et al.
PARS-2010]
16

16

Source code generation with templates

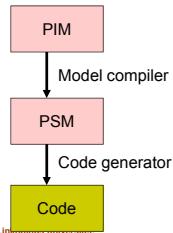

C. Kessler, IDA, Linköpings universitet

Template-based code generation (Model to Text)

MDA vs. MDA-light

OMG-MDA®:

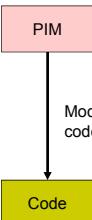

- Clean separation of business logic and platform issues ☺
- More reuse potential ☺ better maintainable, debuggable
- Still under development ☺

C. Kessler, IDA, Linköpings universitet.

MDA-light

- Long way to go in one shot ☹
- PIM polluted with marks for low-level technical stuff ☹
- Works today in practice ☺
 - E.g. xtUML framework at Saab

19

Summary: MDA

Increased reuse

- PIM survives change of platform

Increased programmer productivity

- Part of the code is generated automatically, hence less code to be written by hand

Semi-automatic

Relies on good tools:

- Model editors, model repositories, model transformers, code generators
 - free: Eclipse EMF, GME (ISIS, Vanderbilt U.) for Visual Studio.NET, GMT for Eclipse, IBM MTF, OpenMDX (www.openmdx.org), UMT, Papyrus, Acceleo...
 - and many commercial ones, e.g. Telelogic TAU

Still in its infancy

- Could become the mainstream software engineering technology by 2020

Consistency problem:

- How to map manual edits in PSM or generated code back to a source model?

- Automatic Roundtrip Engineering (ARE)
